no. 10, p. 270-283.

The dynamic properties of cord are evaluated by means of its impact resistance, adhesive strength, and fatigue resistance, and its physical behavior, such as flow, development of heat, rigidity and attenuation. Numerous testing processes have been developed for this purpose. This paper deals with the results of the De Mattia method for an evaluation of the bending or compression fatigue, as well as with tension-relaxation stressing with the Meskat-Rosenberg apparatus for the investigation of growth and attenuation phenomena. The results of both methods are compared with each other and with the behavior of cord in the tire. (Author)

Trans. of Inzhenerno-Fizicheskiy Zhurnal (USSR)
1960, v. 3, no. 3, p. 69-73.

The unrestricted passage of free flowing materials through orifices is investigated. It is established that the flow-rate is determined by the ability of a "dynamic arch" to be formed over the orifice and does not depend either on the height of the column of the free flowing material over the orifice (if it exceeds the diameter of the orifice), or on the character and velocity of the movement of the particles outside the limits of the dynamic arch zone which extends over the orifice by a height approximating to the width of the diameter.
